1 Problem HIRES

1.1 General information

This IVP is a stiff system of 8 non-linear Ordinary Differential Equations. It was proposed by Schäfer in 1975 [Sch75]. The name HIRES was given by Hairer & Wanner [HW96]. It refers to 'High Irradiance RESponse', which is described by this ODE. The parallel-IVP-algorithm group of CWI contributed this problem to the test set. The software part of the problem is in the file hires.f available at [MM08].

1.2 Mathematical description of the problem

The problem is of the form

$$\frac{\mathrm{d}y}{\mathrm{d}t} = f(y), \quad y(0) = y_0,$$

with

$$y \in \mathbb{R}^8, \quad 0 \le t \le 321.8122.$$

The function f is defined by

$$f(y) = \begin{pmatrix} -1.71y_1 & +0.43y_2 & +8.32y_3 & +0.0007 \\ 1.71y_1 & -8.75y_2 & & \\ -10.03y_3 & +0.43y_4 & +0.035y_5 & \\ 8.32y_2 & +1.71y_3 & -1.12y_4 & \\ -1.745y_5 & +0.43y_6 & +0.43y_7 & \\ -280y_6y_8 & +0.69y_4 & +1.71y_5 & -0.43y_6 & +0.69y_7 \\ 280y_6y_8 & -1.81y_7 & & \\ -280y_6y_8 & +1.81y_7 & & \\ \end{pmatrix}$$

The initial vector y_0 is given by $(1, 0, 0, 0, 0, 0, 0, 0.0057)^{\mathrm{T}}$.

1.3 Origin of the problem

The HIRES problem originates from plant physiology and describes how light is involved in morphogenesis. To be precise, it explains the 'High Irradiance Responses' (HIRES) of photomorphogenesis on the basis of phytochrome, by means of a chemical reaction involving eight reactants. It has been promoted as a test problem by Gottwald in [Got77]. The reaction scheme is given in Figure II.1.1.

 P_r and P_{fr} refer to the red and far-red absorbing form of phytochrome, respectively. They can be bound by two receptors X and X', partially influenced by the enzyme E. The values of the parameters were taken from [HW96]

k_1	=	1.71	k_3	=	8.32	k_5	=	0.035	k_+	=	280	k^*	=	0.69
k_2	=	0.43	k_4	=	0.69	k_6	=	8.32	k_{-}	=	0.69	O _{ks}	=	0.0007

For more details, we refer to [Sch75].

Identifying the concentrations of P_r , P_{fr} , P_rX , $P_{fr}X$, P_rX' , $P_{fr}X'$, $P_{fr}X'E$ and E with y_i , $i \in \{1, \ldots, 8\}$, respectively, the differential equations mentioned in §1.2 easily follow. See [SL98] for a more detailed description of this modeling process.

The end point of the integration interval, 321.8122, was chosen arbitrarily [Wan98].

1.4 Numerical solution of the problem

Tables II.1.1–II.1.2 and Figures II.1.2–II.1.6 present the reference solution at the end of the integration interval, the run characteristics, the behavior of the solution over (part of) the integration interval and the work-precision diagrams, respectively. The reference solution was computed by RADAU5 on a Cray C90, using double precision, work(1) = uround = $1.01 \cdot 10^{-19}$, rtol = atol = h0 = $1.1 \cdot 10^{-18}$. For the work-precision diagrams, we used: rtol = $10^{-(5+m/4)}$, $m = 0, 1, \ldots, 28$; atol = rtol; h0 = $10^{-2} \cdot \text{rtol}$ for BIMD, GAMD, MEBDFDAE, MEBDFI, RADAU and RADAU5.

TABLE II.1.1: Reference solution at the end of the integration interval.

y_1	$0.7371312573325668 \cdot 10^{-3}$	y_5	$0.2386356198831331\cdot 10^{-2}$
y_2	$0.1442485726316185 \cdot 10^{-3}$	y_6	$0.6238968252742796 \cdot 10^{-2}$
y_3	$0.5888729740967575 \cdot 10^{-4}$	y_7	$0.2849998395185769 \cdot 10^{-2}$
y_4	$0.1175651343283149\cdot 10^{-2}$	y_8	$0.2850001604814231 \cdot 10^{-2}$
